

Sample 1

Summarize the press release, "Mars Rovers Advance Understanding of the Red Planet.

NASA launched the rover into mars so they think mars can be a safe space to step on then they found bedrocks with little pieces

Sample 2

There were two rovers on mars that were looking for signs of water to see if there was life on mars in the past or if there was not they did find some data to answer that question. But NASA'S rovers have been working to understand mar's environment also the rovers continue exploring on opposite sides of mars ,But there 's more the extended journey both rovers undercover discoveries also NASA'S

Sample 3

NASA sent rovers to mars to see if their was once water in mars NASA decided to let the rover stay in mars because they needed to find more evidence of mars and they were exiating expectation they were examining rocks so they could find past water and the rovers themselves to see why they were doing more what they expected including spirit, They even found bed rock which shows that they found signs of past water but the NASA team needed more evidence of the past water on mars so they sent opportunity to see what it was like on his side of the planet and found another bed rock show signs of past water which shows signs of past water in mar.

Sample 4

The rover's spirit and opportunity have been working on mars for years looking for signs of past water. So far it seems that they have succeeded at the job for NASA has been getting ground breaking evidence. These rovers were meant to only be able to last 90 days but they exceeded that with spirit lasting about 10 years and opportunity lasting 15. During the time they spent on mars opportunity was finding ground breaking evidence of past water between "Endurance" and Victoria" craters. Despite not being able to find signs of past water, spirit still found a wide variety of rocks that prove ground breaking theories. Even now NASA is still trying to find out more about Mars with spirit and opportunity being only two out of the 5 robotic space missions.

Sample 5

There were two rovers on Mars so they could find evidence of water and past water to try to find out if there was ever life on Mars or not and found more than they expected. One of the rovers found bedrock which are layers of rocks which are signs of past water being shown because that only happens when there is water. They also uncovered discoveries that will be new to investigate Mars in the future. The rovers also examined more than they were expected to because they were only supposed to be on Mars for a couple of months then die out. Some things weren't working on the rovers and it was showing signs of it wearing out. And the rovers were still able to work even though parts of it were broken.

Sample 6

Spirit and Opportunity were on Mars to explore and find signs for past water. They are also looking to see if there ever was life on Mars. First, they needed to uncover discoveries and try to start finding proof that there was ever water and life. During their primary missions, the rovers examined more rocks and

Sample 7

The text the Mars rovers were about why the rovers went to Mars one of the reasons was to understand the ancient environmental conditions. Basically, could there have been past water on Mars. One of the other things that the text was about is the new bedrock also showing signs of past water meaning looking at the rocks to see if they could have been connected to places where there could have been water. Another thing that was shown in the text was about other robotic missions meaning that the story was also about other rovers going to Mars that could also help NASA find out if there could have been signs of past water and that also means that they can also get more information and learn more about could there have been water on Mars. Another thing in Mars rover is that

Sample 8

The press release reports on the successful Mars rover missions of Spirit and Opportunity, which were exploring opposite sides of Mars and returning valuable geological data. It explains that the rovers had exceeded their original mission goals by traveling farther than expected, examining diverse bedrock formations, and collecting evidence suggesting ancient environments on Mars that may once have had wet and potentially habitable conditions. All though the rover Opportunity had an issue. Opportunity and NASA kept going determined to keep finding key evidence. The release also highlights the extended mission operations and how the ongoing discoveries were helping scientists improve understanding of the Red Planet's ancient environmental history and shape future Mars exploration.

Sample 9

Nasa launched these two rovers to Mars, because they wanted the rovers to gather information to announce publicly that could also help the scientist gather ideas. One of the rovers was breaking rock and found a new variation of bedrock that just couldn't break, and they were still trying to uncover discoveries and important details about Mars. Nasa wanted the rovers to find new variations and life of past water and if they could find something that the earth doesn't have. Nasa's team was shocked that the Rovers were giving them much more details then asked for and the rovers were giving them very important information that could help a lot of people in the past. The rovers were doing very well by helping Nasa exceed what they were trying to complete. One of the rover's wheels broke and it was stable but not as stable as when it was first made because of how long the rover has been working and it is giving signs of how hard it has worked over time to actually be successful. Nasa still wanted to learn much more about Mars there was only Opportunity and Spirit on mars but Nasa wanted to learn about Mars that the two rovers could of missed, so instead they launched three more rovers to Mars to explore and gather much more information that can help the scientist and the people on earth to much better understand what is on Mars.

Sample 10

Nasa made 2 rovers Spirits and Opportunity to study the mars once spirit and opportunity landed they found different types of bedrocks in different areas on mars. Then rover was planed to last for

Sample 11

In the press release“Mars rovers Advance understanding of the red planet” at first it's about what opportunity and Spirit are doing on Mars and how they are helping the scientist, but then it explains what spirit and opportunity are discovering and how it will help the scientist. After that the rovers found new investigations so that they can explore Mars. Also while Spirit and Opportunity were exploring they weren't the only ones on mars. But even though Spirit and Opportunity were exploring well they have seemed to start breaking down little by little. For example the wheel stopping and even a broken wire. Spirit and Opportunity were also showing signs of wear.

Sample 12

NASA sent two rovers to Mars to see if there were signs of past water. Nasa rovers continue to find different bed rock and trying to get new bed rock

Sample 13

This passage is an original source by Nasa itself. This passage is about two rovers, Spirit and Opportunity, on Mars and some of the things they are doing. Nasa sent these rovers to Mars to study the Martian surface, to ease human curiosity. The rovers were sent to find geological evidence that the scientists can make hypotheses on. Since a human can't make the journey, they send robots to do it for us. Many of the things Spirit and Opportunity did on Mars was make important discoveries that would change this world as we know it. The rovers were only expected to last 9 weeks, but the rovers extended that criteria for years, living year after year after the deadline. After a while though the rovers start showing signs of wear, and the rovers start to die. This pamphlet explains all this and more, as we see the beauty of the scientific world unfold.

Sample 14

Mars Rover Advance Understanding of the Red Planet is a primary text, and nonfiction, written and published by NASA. It's about how a pair of rovers named Spirit and Opportunity were sent to Mars by NASA for a space exploration to find signs of past water to support their big question. They continue to find evidence that adds to this big question: DID MARS SUPPORT LIFE ONCE. The reason why NASA sent 2 rovers on Mars was also to understand Mars a bit more. While on the space exploration Spirit and Opportunity were very successful not only lived and explored more, but even when they were starting to break they still went to their max capabilities. Spirit and Opportunity were not the only robots on Mars. There were 3 more robots on a space exploration mission. But Spirit and Opportunity will continue to work hard helping NASA to complete their goal.illusion

Sample 15

The rovers, Spirit and Opportunity, were on Mars looking for signs of past water on Mars. The rovers found things like variations of bedrock which show signs of past water. They stayed on the planet for a long time, finding new pieces of evidence. The rovers exceeded their expectations one way by staying on Mars for 10-18 years. Opportunity discovers craters that revealed a lot about Mars' past and signs of past water. Spirit looked at many rocks to find signs of past water. Spirit was worn out but still managed to meet a few expectations. Opportunity was also worn out but managed to meet the expectations of NASA. NASA also sent orbiters that went around Mars and collecting data about Mars' past.

Sample 16

NASA made a rover to explore Mars and find signs of past water. The rovers worked over time to have a better understanding of Mars. The rovers found bedrock and rocks that showed signs of water. They uncover discoveries that will enable investigations. They examined more rocks then proceeded. Opportunity the rover finds signs of water. On January 3rd NASA found that Spirit the rover can climb hills. The rovers are worn out , so maybe the mission is almost coming to an end. Opportunity's wheel broke , but it is still usable. The rovers provided an understanding for NASA.

Sample 17

In this it shows that in mars there was many different environments , that is shown because in the text it showed that there was many ancient environmental conditions . in the text is showed that they tried to find past life . that it shown in the text saying ,that there is habitable conditions. In the text it showed that there was alot of undiscovered.in the text one word to describe that was where it said that they will inable new investigations do diffrent discoveries. In another part of the text it explains where the rover did more than expected , what it means by more than expected is that the rover was expected to do at least 3 months by instead the rover did lots of years . in the text it when the rove got to the three years it for a crater and it was called the victoria crater and in the crater was a sign of past water .

Sample 18

On Mars there were two rovers named Spirit and Opportunity that visited NASA. They were looking for signs there was water and were also searching for bed rock craters. NASA rovers have been working to understand Mars' environment and how they can find land on Mars easily. NASA rovers continue to find kinds of bed rock. This important information because this could be signs of life on mars. The extended journey both rovers under rover discovery. This shows how the rover was discovered. The rover also kept finding and examining craters. This shows how the rover was examining craters.

Sample 19

NASA sent two rovers to Mars to find past life of water on Mars or any type of past life to study more about the discovery of Mars. The discovery that they found was periods of wet, possibly habitable. Paragraphe 2

Sample 20

Spirit and opportunity went to mars to see life and water on mars. Spirt and opportunity went to find find bedrock
